Laboratory Report

Experiment Title: Cloud-Native Automated Deployment

Date	2026-06-10	Class	2
Name	姜丞骏	Student ID	
GitHub Account	whatokk	Teacher	yhldrf / yhldrf@gmail.com
Repository	whatokk/cloud-computing-lab-github	Live URL	https://whatokk.github.io/cloud-computing-lab-github/

一、Experimental Purpose

The purpose of this experiment is to practice a cloud-native automated deployment workflow using GitHub as a PaaS-like platform. The experiment covers forking a cloud repository, enabling GitHub Pages, triggering GitHub Actions, verifying a globally accessible website, and inviting the teacher as a collaborator.

二、Experiment Contents

- Forked/acquired the cloud computing lab repository.
- Enabled GitHub Pages with GitHub Actions as the build and deployment source.
- Personalized index.html by adding the student name, UI style changes, and an external image.
- Triggered the Cloud-Deployment-Pipeline and verified that the workflow completed successfully.
- Opened and verified the live GitHub Pages URL.
- Invited teacher yhldrf as a collaborator with write permission.

三、Detailed Steps and Results

Step 1 Resource Acquisition

Logged in to GitHub and used the lab source repository <https://github.com/yhldrf/cloud-computing-lab-github>. Because a previous same-name fork already existed in the account, the existing fork was updated for Lab6 while preserving the separate report-submission branch.

Step 2 Enabling the Hosting Service

Configured GitHub Pages to use workflow deployment. The Pages API returned `build_type=workflow` and the live site URL.

Step 3 Triggering Cloud Automation

Edited `index.html`: replaced the placeholder name with 姜丞骏, changed the background color and status color, and added a GitHub Actions image. The changes were committed and pushed to main, then the Cloud-Deployment-Pipeline workflow was triggered.

Step 4 Verification and Global Access

The workflow completed with `conclusion=success`. The website was available at <https://whatokk.github.io/cloud-computing-lab-github/>, and the downloaded live HTML contains Student Name: 姜丞骏 and Site Status: Live.

Step 5 Content Personalization

The UI style was updated to a light gray background, the status text was changed to blue, and an external SVG image was included using an `img` tag.

Collaborator

Teacher account `yhldrf` was invited as collaborator with write permission. GitHub creates an invitation that the teacher can accept from GitHub.

四、Evidence Screenshots

Figure 1. Repository and GitHub Pages configuration.

五、Reflection

Where is the website stored? The source files are stored in the GitHub repository, and the deployed static website is served through GitHub Pages using artifacts produced by GitHub Actions.

Did you have to install any software? The cloud deployment itself did not require installing server software. GitHub provided the repository hosting, Ubuntu runner, deployment workflow, and Pages hosting service. Local GitHub CLI was only used to automate the same operations more efficiently.

Problems Encountered and Proposed Solutions: The account already had a same-name fork from another lab submission, so a clean Lab6 main branch was reconstructed from the teacher source repository and the previous PR branch was left untouched. The workflow was then manually enabled and dispatched to guarantee a verifiable run record.
